Foreword	xiii
Preface	xvii
1 Classification of differential equations	1
2 Models in one dimension	9
2.1 Heat flow in a bar; Fourier's law	9
2.1.1 Boundary and initial conditions for the heat equation	13
2.1.2 Steady-state heat flow	14
2.1.3 Diffusion	16
2.2 The hanging bar	21
2.2.1 Boundary conditions for the hanging bar	24
2.3 The wave equation for a vibrating string	27
2.4 Suggestions for further reading	30
3 Essential linear algebra	31
3.1 Linear systems as linear operator equations	31
3.2 Existence and uniqueness of solutions to $\mathbf{Ax} = \mathbf{b}$	38
3.2.1 Existence	38
3.2.2 Uniqueness	42
3.2.3 The Fredholm alternative	45
3.3 Basis and dimension	50
3.4 Orthogonal bases and projections	55
3.4.1 The L^2 inner product	58
3.4.2 The projection theorem	61
3.5 Eigenvalues and eigenvectors of a symmetric matrix	68
3.5.1 The transpose of a matrix and the dot product	71
3.5.2 Special properties of symmetric matrices	72
3.5.3 The spectral method for solving $\mathbf{Ax} = \mathbf{b}$	74
3.6 Preview of methods for solving ODEs and PDEs	77
3.7 Suggestions for further reading	78

4	Essential ordinary differential equations	79
4.1	Converting a higher-order equation to a first-order system	79
4.2	Solutions to some simple ODEs	82
4.2.1	The general solution of a second-order homogeneous ODE with constant coefficients	82
4.2.2	A special inhomogeneous second-order linear ODE	85
4.2.3	First-order linear ODEs	87
4.3	Linear systems with constant coefficients	91
4.3.1	Homogeneous systems	92
4.3.2	Inhomogeneous systems and variation of parameters	96
4.4	Numerical methods for initial value problems	101
4.4.1	Euler's method	102
4.4.2	Improving on Euler's method: Runge-Kutta methods	104
4.4.3	Numerical methods for systems of ODEs	108
4.4.4	Automatic step control and Runge-Kutta-Fehlberg methods	110
4.5	Stiff systems of ODEs	115
4.5.1	A simple example of a stiff system	117
4.5.2	The backward Euler method	118
4.6	Green's functions	123
4.6.1	The Green's function for a first-order linear ODE	123
4.6.2	The Dirac delta function	125
4.6.3	The Green's function for a second-order IVP	126
4.6.4	Green's functions for PDEs	127
4.7	Suggestions for further reading	128
5	Boundary value problems in statics	131
5.1	The analogy between BVPs and linear algebraic systems	131
5.1.1	A note about direct integration	141
5.2	Introduction to the spectral method; eigenfunctions	144
5.2.1	Eigenpairs of $-\frac{d^2}{dx^2}$ under Dirichlet conditions	144
5.2.2	Representing functions in terms of eigenfunctions	146
5.2.3	Eigenfunctions under other boundary conditions; other Fourier series	150
5.3	Solving the BVP using Fourier series	155
5.3.1	A special case	155
5.3.2	The general case	156
5.3.3	Other boundary conditions	161
5.3.4	Inhomogeneous boundary conditions	164
5.3.5	Summary	166
5.4	Finite element methods for BVPs	172
5.4.1	The principle of virtual work and the weak form of a BVP	173
5.4.2	The equivalence of the strong and weak forms of the BVP	177
5.5	The Galerkin method	180

5.6	Piecewise polynomials and the finite element method	188
5.6.1	Examples using piecewise linear finite elements	193
5.6.2	Inhomogeneous Dirichlet conditions	197
5.7	Green's functions for BVPs	202
5.7.1	The Green's function and the inverse of a differential operator	207
5.8	Suggestions for further reading	210
6	Heat flow and diffusion	211
6.1	Fourier series methods for the heat equation	211
6.1.1	The homogeneous heat equation	214
6.1.2	Nondimensionalization	217
6.1.3	The inhomogeneous heat equation	220
6.1.4	Inhomogeneous boundary conditions	222
6.1.5	Steady-state heat flow and diffusion	224
6.1.6	Separation of variables	225
6.2	Pure Neumann conditions and the Fourier cosine series	229
6.2.1	One end insulated; mixed boundary conditions	229
6.2.2	Both ends insulated; Neumann boundary conditions	231
6.2.3	Pure Neumann conditions in a steady-state BVP	237
6.3	Periodic boundary conditions and the full Fourier series	245
6.3.1	Eigenpairs of $-\frac{d^2}{dx^2}$ under periodic boundary conditions	247
6.3.2	Solving the BVP using the full Fourier series	249
6.3.3	Solving the IBVP using the full Fourier series	252
6.4	Finite element methods for the heat equation	256
6.4.1	The method of lines for the heat equation	260
6.5	Finite elements and Neumann conditions	266
6.5.1	The weak form of a BVP with Neumann conditions	266
6.5.2	Equivalence of the strong and weak forms of a BVP with Neumann conditions	267
6.5.3	Piecewise linear finite elements with Neumann conditions	269
6.5.4	Inhomogeneous Neumann conditions	273
6.5.5	The finite element method for an IBVP with Neumann conditions	274
6.6	Green's functions for the heat equation	279
6.6.1	The Green's function for the one-dimensional heat equation under Dirichlet conditions	280
6.6.2	Green's functions under other boundary conditions	281
6.7	Suggestions for further reading	283
7	Waves	285
7.1	The homogeneous wave equation without boundaries	285
7.2	Fourier series methods for the wave equation	291
7.2.1	Fourier series solutions of the homogeneous wave equation	293

7.2.2	Fourier series solutions of the inhomogeneous wave equation	296
7.2.3	Other boundary conditions	301
7.3	Finite element methods for the wave equation	305
7.3.1	The wave equation with Dirichlet conditions	306
7.3.2	The wave equation under other boundary conditions	312
7.4	Point sources and resonance	318
7.4.1	The wave equation with a point source	318
7.4.2	Another experiment leading to resonance	321
7.5	Suggestions for further reading	324
8	Problems in multiple spatial dimensions	327
8.1	Physical models in two or three spatial dimensions	327
8.1.1	The divergence theorem	328
8.1.2	The heat equation for a three-dimensional domain	330
8.1.3	Boundary conditions for the three-dimensional heat equation	332
8.1.4	The heat equation in a bar	333
8.1.5	The heat equation in two dimensions	334
8.1.6	The wave equation for a three-dimensional domain	334
8.1.7	The wave equation in two dimensions	334
8.1.8	Equilibrium problems and Laplace's equation	335
8.1.9	Green's identities and the symmetry of the Laplacian	336
8.2	Fourier series on a rectangular domain	339
8.2.1	Dirichlet boundary conditions	339
8.2.2	Solving a boundary value problem	345
8.2.3	Time-dependent problems	346
8.2.4	Other boundary conditions for the rectangle	348
8.2.5	Neumann boundary conditions	349
8.2.6	Dirichlet and Neumann problems for Laplace's equation	352
8.2.7	Fourier series methods for a rectangular box in three dimensions	354
8.3	Fourier series on a disk	359
8.3.1	The Laplacian in polar coordinates	360
8.3.2	Separation of variables in polar coordinates	362
8.3.3	Bessel's equation	363
8.3.4	Properties of the Bessel functions	366
8.3.5	The eigenfunctions of the negative Laplacian on the disk	368
8.3.6	Solving PDEs on a disk	372
8.4	Finite elements in two dimensions	377
8.4.1	The weak form of a BVP in multiple dimensions	377
8.4.2	Galerkin's method	378
8.4.3	Piecewise linear finite elements in two dimensions	379
8.4.4	Finite elements and Neumann conditions	388

		xi
<hr/>		
8.4.5	Inhomogeneous boundary conditions	389
8.5	Suggestions for further reading	392
9	More about Fourier series	393
9.1	The complex Fourier series	394
9.1.1	Complex inner products	395
9.1.2	Orthogonality of the complex exponentials	396
9.1.3	Representing functions with complex Fourier series	397
9.1.4	The complex Fourier series of a real-valued function	398
9.2	Fourier series and the FFT	401
9.2.1	Using the trapezoidal rule to estimate Fourier coefficients	402
9.2.2	The discrete Fourier transform	404
9.2.3	A note about using packaged FFT routines	409
9.2.4	Fast transforms and other boundary conditions; the discrete sine transform	410
9.2.5	Computing the DST using the FFT	411
9.3	Relationship of sine and cosine series to the full Fourier series	415
9.4	Pointwise convergence of Fourier series	419
9.4.1	Modes of convergence for sequences of functions	419
9.4.2	Pointwise convergence of the complex Fourier series	422
9.5	Uniform convergence of Fourier series	436
9.5.1	Rate of decay of Fourier coefficients	436
9.5.2	Uniform convergence	439
9.5.3	A note about Gibbs's phenomenon	443
9.6	Mean-square convergence of Fourier series	444
9.6.1	The space $L^2(-\ell, \ell)$	445
9.6.2	Mean-square convergence of Fourier series	448
9.6.3	Cauchy sequences and completeness	450
9.7	A note about general eigenvalue problems	455
9.8	Suggestions for further reading	459
10	More about finite element methods	461
10.1	Implementation of finite element methods	461
10.1.1	Describing a triangulation	462
10.1.2	Computing the stiffness matrix	465
10.1.3	Computing the load vector	467
10.1.4	Quadrature	467
10.2	Solving sparse linear systems	473
10.2.1	Gaussian elimination for dense systems	473
10.2.2	Direct solution of banded systems	475
10.2.3	Direct solution of general sparse systems	477
10.2.4	Iterative solution of sparse linear systems	478
10.2.5	The conjugate gradient algorithm	482
10.2.6	Convergence of the CG algorithm	485
10.2.7	Preconditioned CG	486

10.3	An outline of the convergence theory for finite element methods	488
10.3.1	The Sobolev space $H_0^1(\Omega)$	489
10.3.2	Best approximation in the energy norm	491
10.3.3	Approximation by piecewise polynomials	491
10.3.4	Elliptic regularity and L^2 estimates	492
10.4	Finite element methods for eigenvalue problems	494
10.5	Suggestions for further reading	499
A	Proof of Theorem 3.47	501
B	Shifting the data in two dimensions	505
B.0.1	Inhomogeneous Dirichlet conditions on a rectangle	505
B.0.2	Inhomogeneous Neumann conditions on a rectangle	508
C	Solutions to odd-numbered exercises	515
	Bibliography	603
	Index	607
